

I connect the systems a business already owns, so people stop reconciling them by hand.

Over the past year I ran IT for a small distribution operation with no in-house dev team. Everything below shipped and runs in production — spreadsheets talking to accounting software, e-commerce catalogs staying in sync overnight, dashboards built because the stock ones didn't answer the actual question. Details below are genericized; the systems are real.

None of this came from a formal engineering background — it came from treating AI platforms as a working partner: pairing with them to design architecture, write and debug production code, and move from "we have a problem" to a shipped system far faster than doing it alone.

All company names, data, and domains have been removed or replaced with generic placeholders. Architecture, tooling, and approach are described as built.

FIG. 0 — GENERALIZED SHAPE OF THE WORK ACROSS ALL SIX SHEETS BELOW

Python

PRIMARY TOOL, BY CHOICE

Tools reached for repeatedly

- Python
- Flask
- REST APIs
- OAuth2
- Docker
- Linux
- cron
- SQL
- Google Workspace APIs
- Frappe / ERPNext
- WireGuard
- pandas

AI-assisted development

All six systems above are in active production use, built and maintained solo alongside day-to-day IT operations. Company-identifying names, domains, and data have been removed for this portfolio; happy to walk through real screenshots, code, or architecture in more detail on request.
